

1.4.3 Quick search

The **Quick Search** function is designed to return results for any keyword typed into the box. For example, typing in a number such as 5045 will return any datasets containing this number such as lot/plans, mining tenements, property addresses etc.

From the Map page, go to the **Quick Search** located at the top left of the screen – as per the image below – and start typing in the town, road, river, or address you wish to search and zoom to (e.g. William).

Lot	Plan	Unit Number	Unit Type	Street Number	Street Name	Street Type
1	SP287539			1	William	Street

Notice the drop down list filters the results based on each letter you type. Once you have found the feature you want to zoom to in the drop down list, stop typing and select the record in the list. The map will then navigate to the feature selected.
